

Example error: No language in PDF

No language

This document has no language declared.

Result	Detected	Detected

Ally checker shows

“This PDF does not have a language set”

This is accurate, although it’s unlikely to occur. Forcing an error in this space required exporting an Encapsulated PostScript (.eps) and converting to PDF, then manually tagging the document without indicating the language of the document. This would be a more likely to occur on scanned pages uploaded as PDF documents where the content is image only.
